

ENERGY EVOLVED

Why should I choose Bright Eye Solar?

It can get overwhelming when trying to decide who you want to put your trust in to get things done right. We've laid out the top reasons why we feel you'll be satisfied when you choose us to help you go solar.

1 Solar electricity is our specialty

Simply put: Solar, it's what we do. We are not an electrical or roofing company adding solar electric as a means to increase our profits for our primary business. From Design to installation, we focus on the details. We make sure that your system meets the highest standards in the industry and operates at its fullest potential.

2 Affordable, high quality components

We install components that have been proven to be some of the best in the industry. The primary components we use are manufactured in the U.S.A. so you can feel good about supporting manufacturers and jobs within your country.

3 Remote monitoring and management

Customers often complain that after their system is installed they do not know for sure if it is producing what it should be. Sometimes there are issues that go unnoticed that may cost the owner thousands of dollars in the long term. Bright Eye Solar provides affordable web monitoring that will allow the customer to see what the system is currently producing, as well as a logged production history for any set period of time. This also allows us to monitor your system remotely and make sure it's producing at the level it should be. If anything out of the normal happens with your system, the monitoring device will notify us so we can troubleshoot the issue and get your system back up to the performance level that it should be functioning.

4 Free professional solar module cleaning

Many installers will tell the customer that they will never need to clean their modules. While it is true that nature does a fairly good job of washing them, there are many instances where, pollen, bird droppings and dirt can cause a significant reduction in power output. Bright Eye Solar provides customers within a 20 mile radius a designated number of free professional module cleanings. Additional cleanings can be purchased at an affordable price. With the use of our remote monitoring device, we will also make module cleaning recommendations based upon reductions in power output due to seasonal conditions.

5 Industry leading 10 year warranty on workmanship

Solar electric is an investment that you should't need to worry about after it is installed. That is why in addition to the 25 year manufacturer's warranty on the modules and 10 year warranty on the inverter, Bright Eye Solar provides an additional 10 year warranty on workmanship. These warranties insure many years of trouble-free energy production and guarantee you'll receive a great return on your investment.

6 We do things right

The competition between solar installation companies is strong and some installation companies are providing low ball pricing that uses components and installation practices that are questionable at best. Inferior components and installation practices can lead to roof leaks, shorts in the wiring, loose modules, corrosion or rust and solar electric systems that under perform. We treat every customer's installation on their home or business as if it were on our own. That means we maintain a keen eye for detail and make sure we do things right.
